

Management in digital prototyping (GEA)
Guía docente 2026-27

INTRODUCTION

Architects of today navigate dual realms – the tangible world of the conventional-physical and the immersive dimension of the virtual. In architectural design and artistry, these spheres seamlessly blend, allowing for flexibility and creativity. Virtual reality has emerged as a powerful tool, often born of intricate computations, capable of addressing needs in the real world.

In parallel with Virtual and Augmented Reality, Artificial Intelligence (AI) has become an emerging instrument for the generation of image, concept, and form. Within architectural design, AI models expand the range of imagination, enabling designers to explore unprecedented formal, material, and conceptual scenarios. In this course, AI is understood not as a substitute for creativity but as an augmentative and critical tool—a new layer in the evolving dialogue between human intention and computational possibility.

The collaborative effort of CAD (Computer Aided Design) and CAM (Computer Aided Manufacturing) forms the cornerstone of modern industrial processes. These tools, including 3D printing, laser cutting, CNC, cutting plotter, mechanical arm, drones, etc., are multiplying and growing in their potential.

One groundbreaking example of these evolving technologies is the construction technique utilizing drones for stacking elements, which will undoubtedly become standard in the future. An illustrative study on drone-based Additive Manufacturing of Architectural Structures by MIT + UCL research group exemplifies this. Similarly, 3D printing through drones is explored in the project led by Robert Stuart Smith of AA DRL.

Modern product manufacturing necessitates the preliminary creation of virtual models for trial and testing purposes. BIM models, for instance, are a reflection of this technique. Sometimes, the virtual model becomes the final product, as seen in video games.

Absolute control over form in computational design is vital for these technological advancements. An approximate or imperfect form does not suffice. Virtual reality, underpinned by numerical codes, demands a precise form-code translation via a logical-mathematical process. The emergence of computational processes pertaining to iteration and recursion presents a new paradigm in architecture, design, and art.

PREREQUISITES

This course does not necessitate a specific disciplinary background. However, a solid general academic foundation and academic skills, such as synthesis, analysis, and comparison, will be instrumental. The ability to critically absorb academic material is also essential.

The course assumes a foundational understanding of contemporary issues and modern architectural history. A keen interest in digital design and fabrication, and basic competencies in oral and written communication are also expected. The course requires students to conduct independent research and produce high-quality academic projects.

COURSE REQUIREMENTS

Attendance and Participation

Full attendance is mandatory. Unexcused absences will affect the final grade. Participation grades will reflect the student's continuous engagement in class activities, reinforced by the timely completion of course readings.

COURSE READINGS

Students will receive a series of readings prior to seminars. Each seminar will include student-led presentations on the assigned readings.

Universidad
de Navarra

CREDITS

This course holds a value of 4.5 ECTS credits. Course Semester: 1st Semester Instruction
Language: English, Spanish

FACULTY

Course Coordinator: Fernando Alonso Faculty: Adam Jorquera, Fernando Alonso

LEARNING OUTCOMES (Competencies)

BASIC COMPETENCES

BC02 Students must know how to apply their knowledge professionally to their job or career and have the skills that usually demonstrated by writing and supporting their arguments, and problem-solving within their area of study.

BC04 Students are able to convey information, ideas, problems and solutions to specialist and non-specialist audiences.

BC05 Students have developed the learning skills necessary to undertake further studies with a high degree of autonomy.

GENERAL COMPETENCES

GC01 Understand the history and theories of architecture and related arts, technologies and human sciences.

SPECIFIC COMPETENCES

SC01 Ability to apply graphic procedures when representing spaces and objects (T).

SC02 Ability to conceive and represent the visual attributes of objects and good mastery of proportion and drawing techniques, including computer techniques (T).

SC67 Use of English, level B2, to a sufficient level for the scientific and academic terminology typically used in architecture.

COURSE AIMS, OBJECTIVES, AND PROCEDURES

This course is designed to acquaint students with key concepts and methodologies vital to the creation of modern prototypes. The central focus will be on understanding and applying additive manufacturing techniques for physical prototype production in the realm of architecture. Additive manufacturing, a robust and direct tool for design and innovation, enables rapid prototyping. We will explore and enhance skills required for prototype development via the iterative work process. Iteration and recursion are foundational mechanisms facilitating the generation and selection of an array of models, leading to the final solution.

Alongside additive manufacturing and parametric modeling, the course integrates AI-based generative workflows for conceptual and formal exploration. Students will experiment with diffusion models and image-to-form translation as part of the design process, reflecting on the ethical, aesthetic, and disciplinary implications of algorithmic creativity.

The course aims for a comprehensive understanding of the primary 3D printing technologies and their associated materials. It emphasizes a practical grasp of these technologies' mechanical properties and geometric limitations. Students will learn to operate and maintain printers autonomously, to apply finishing techniques and post-process parts, and familiarize themselves

Universidad de Navarra

with the rules and regulations for preparing files for each technology and specific material production.

The course incorporates a collaborative project where students will design an artistic installation grounded in a contemporary concept. Digital printing will serve as a means of creating joints for large-scale precast elements, envisioning joints as both static elements and dynamic components like gears, hinges, and flexible joints. This inventive use of 3D printing is supplemented by specific exercises to hone software skills, utilizing Rhinoceros + Grasshopper and Fusion 360.

Our teaching methodology fosters architectural research and knowledge production that will find its practical application in the 'prototype project.' Here, students will employ 3D-printing digital model making to design and fabricate a prototype matrix, reflecting its evolution through a similar taxonomic approach.

The course will pay particular attention to the following areas:

Theoretical Knowledge

Encouraging critical thinking in the development of structures and concepts in contemporary architecture.

Fostering critical analysis of the construction and building limitations of Computer Aided Manufacturing.

Practical Knowledge

Offering an overview of the operational and managerial aspects of major 3D printing technologies.

Imparting understanding of the benefits and limitations of each technology.

Explaining the norms and rules for designing and preparing files for 3D printing in each technology.

Providing tools to assist students in selecting the most appropriate technology for each phase and project.

I. IN-CLASS ACTIVITIES

Lectures

The instructor will deliver lectures based on the course syllabus using various pedagogical tools such as the blackboard, PowerPoint presentations, videos, and animations. After each lecture, the instructor will upload the PowerPoint presentation, notes for each topic, and recommendations for further reading on the ADI platform.

Seminars (Mandatory)

Seminars will encompass:

The professor and peers addressing students' questions.

The professor presenting contemporary scientific issues pertinent to the course.

Universidad de Navarra

Students delivering oral presentations on topics suggested by the professor. The class will be divided into groups of five students each. Each group will present a 7-10 minute talk, followed by a Q&A session.

One-to-one Consultations

Students can schedule individual meetings with the professor for personalized guidance with study and learning.

Assessments

Examinations will be conducted to gauge the successful attainment of course objectives.

II. INDEPENDENT STUDY

For students to grasp subsequent material, it is crucial to understand early course topics and integrate knowledge gained throughout the course. Hence, students should ensure they are up-to-date with the course material and allocate regular study times outside of class.

Students must familiarize themselves with the assigned reading for a topic before the corresponding lecture. This preparation will maximize learning during the lecture.

Students should engage in self-study using the professor's notes, lecture notes, and recommended textbooks if required.

Students will prepare oral presentations in English.

ACTIVITY BREAKDOWN (4,5 ECTS = 112,5 hours, 25 hours/ECTS)

Lectures: 1 ECTS, 25 hours, 26.7%

Seminars: 0.2 ECTS, 5 hours, 10.0%

Evaluation/Assessments: 0.08 ECTS, 2 hours, 2.6%

Total In-Class Activities: 1.28 ECTS, 32 hours, 39.3%

One-to-one Consultations: 0.04 ECTS, 1 hour, 0.7%

Independent Study: 2.5 ECTS, 62.5 hours, 60.0%

Total Course Commitment: 4.5 ECTS, 112,5 hours, 100%

Assessment and Evaluation

The final course grade will be calculated based on the following components:

Attendance and Participation: 10%

Universidad de Navarra

Exercises and Submissions: 40%

Project Prototype Design for 'Joints Installation': 50%

Each seminar will be evaluated considering the content of the oral presentation as well as the students' English communication skills. Evaluation criteria will be posted on ADI in advance.

The concluding Jury session will be on X November. For those interested in improving their final grade, an optional essay question will be available during the final exam. This question will derive from recommended readings and has the potential to boost the final score by up to one point.

Passing Criteria

A minimum score of 5 points is required to pass the course. Those scoring below 5 points will receive a grade of 'Suspenso' (Fail). Absence from the final exam will result in a grade of 'No presentado' (Not Presented).

Exam Review

After the announcement of grades, students will have the opportunity to review their exams during a one-on-one session with the professor. The specific date and location will be communicated in due course.

Special Assessment for Resit Exams

For those who do not pass the course in May or fail to appear for the exam (graded 'Suspenso' or 'No presentado'), a resit opportunity will be provided in June. This typically involves enhancing and refining the projects undertaken during the semester.

Accommodation for Students with Special Learning Needs

We are committed to providing equal opportunities for all students. Students with special learning needs can expect accommodations concerning course methodology and/or evaluation. However, they will still be required to meet all course objectives. Please communicate your specific needs to the professor at the start of the course to arrange suitable accommodations.

HORARIOS DE ATENCIÓN

Dr Fernando Alonso Pedrero falonsop@unav.es

- Despacho B2 Edificio Arquitectura. Planta 2
- Horario de tutoría: Concertar Cita Previa.
